

Chlamydia

Chlamydia pneumoniae is a species of Chlamydophila, an obligate intracellular bacterium (parasitic microorganism) that infects humans by invading a host cell to reproduce.

It is a known co-infection of Lyme disease and can be transmitted by an infected tick. It is a major cause of pneumonia and can cause a wide variety of illnesses such as fibromyalgia, IBD, MS, Guillain-Barré syndrome, meningoencephalitis, cancer, lupus, arthritis, asthma, myocarditis, and others.
